Why Review Calculus???

It's a good warm-up for our brains!

When developing numerical schemes we will use theorems from calculus to guarantee that our algorithms make sense.

If the theory is sound, when our programs fail we look for bugs in the code!

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Background Material — A Crash Course in Calculus

Key concepts from Calculus

- Limits
- Continuity
- Convergence
- Differentiability
- Rolle's Theorem
- Mean Value Theorem
- Extreme Value Theorem
- Intermediate Value Theorem

Limit / Continuity

Definition (Limit)

A function f defined on a set X of real numbers $X \subset \mathbb{R}$ has the limit L at x_0 , written

$$\lim_{x\to x_0}f(x)=L$$

if given any real number $\epsilon > 0$ ($\forall \epsilon > 0$), there exists a real number $\delta > 0$ $(\exists \delta > 0)$ such that $|f(x) - L| < \epsilon$, whenever $x \in X$ and $0 < |x - x_0| < \delta$.

Definition (Continuity (at a point))

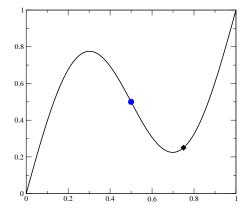

Let f be a function defined on a set X of real numbers, and $x_0 \in X$. Then f is continuous at x_0 if

$$\lim_{x\to x_0}f(x)=f(x_0).$$

Limits, Continuity, and Convergence

Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Examples: "Spike" Discontinuity

The function

$$f(x) = \begin{cases} 1 & x = 0.5 \\ 0 & x \neq 0.5 \end{cases}$$

has a discontinuity at $x_0 = 0.5$.

The limit exists, but

$$\lim_{x\to 0.5} f(x) = 0 \neq 1$$

-

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

(ロ) (部) (注) ()

Continuity / Convergence

Definition (Continuity (in an interval))

The function f is continuous on the set X ($f \in C(X)$) if it is continuous at each point x in X.

Definition (Convergence of a sequence)

Let $\mathbf{x} = \{x_n\}_{n=1}^{\infty}$ be an infinite sequence of real (or complex numbers). The sequence **x** converges to x (has the limit x) if $\forall \epsilon > 0, \exists N(\epsilon) \in \mathbb{Z}^+: |x_n - x| < \epsilon \ \forall n > N(\epsilon)$. The notation

 $\lim_{n\to\infty} x_n = x$

means that the sequence $\{x_n\}_{n=1}^{\infty}$ converges to x.

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

(ロ) (部) (注) ()

Illustration: Convergence of a Complex Sequence

A sequence in $\underline{z} = \{z_k\}_{k=1}^{\infty}$ converges to $z_0 \in \mathbb{C}$ (the black dot) if for any ϵ (the radius of the circle), there is a value N (which depends on ϵ) so that the "tail" of the sequence $\underline{z}_t = \{z_k\}_{k=N}^{\infty}$ is inside the circle.

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Differentiability

Theorem

If f is a function defined on a set X of real numbers and $x_0 \in X$, the the following statements are equivalent:

- (a) f is continuous at x_0
- (b) If $\{x_n\}_{n=1}^{\infty}$ is any sequence in X converging to x_0 , then $\lim_{n\to\infty} f(x_n) = f(x_0)$.

Definition (Differentiability (at a point))

Let f be a function defined on an open interval containing x_0 ($a < x_0 < b$). f is differentiable at x_0 if

$$f'(x_0) = \lim_{x \to x_0} \frac{f(x) - f(x_0)}{x - x_0}$$
 exists.

If the limit exists, $f'(x_0)$ is the derivative at x_0 .

Definition (Differentiability (in an interval))

If $f'(x_0)$ exists $\forall x_0 \in X$, then f is differentiable on X.

$$\lim_{x \to x_0} \frac{f(x) - f(x_0)}{x - x_0}$$

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Continuity / Rolle's Theorem

Theorem (Differentiability \Rightarrow Continuity)

If f is differentiable at x_0 , then f is continuous at x_0 .

Theorem (Rolle's Theorem ^{Wiki-Link})

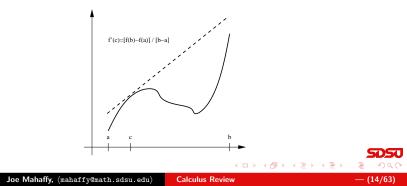

Suppose $f \in C[a, b]$ and that f is differentiable on (a, b). If f(a) = f(b), then $\exists c \in (a, b)$: f'(c) = 0.

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Mean Value Theorem

Theorem (Mean Value Theorem Wiki-Link) If $f \in C[a, b]$ and f is differentiable on (a, b), then $\exists c \in (a, b)$: $f'(c) = \frac{f(b) - f(a)}{b - a}$.

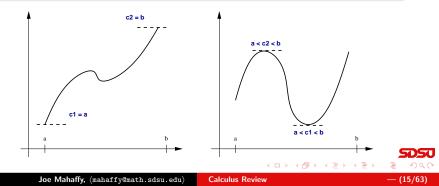

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Extreme Value Theorem

Theorem (Extreme Value Theorem ^{Wiki-Link})

If $f \in C[a, b]$ then $\exists c_1, c_2 \in [a, b]$: $f(c_1) \leq f(x) \leq f(c_2)$ $\forall x \in [a, b]$. If f is differentiable on (a, b) then the numbers c_1, c_2 occur either at the endpoints of [a, b] or where f'(x) = 0.

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Intermediate Value Theorem

Theorem (Intermediate Value Theorem Wiki-Link)

if $f \in C[a, b]$ and K is any number between f(a) and f(b), then there exists a number c in (a, b) for which f(c) = K.

・ロト ・ ア・ ・ ヨト ・ ヨト

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

- 4 課 2 - 4 注 2 - 4 注 2

Taylor's Theorem

Theorem (Taylor's Theorem Wiki-Link)

Suppose $f \in C^n[a, b]$, $f^{(n+1)} \exists$ on [a, b], and $x_0 \in [a, b]$. Then $\forall x \in (a, b)$, $\exists \xi(x) \in (x_0, x)$ with $f(x) = P_n(x) + R_n(x)$ where

$$P_n(x) = \sum_{k=0}^n \frac{f^{(k)}(x_0)}{k!} (x-x_0)^k, \quad R_n(x) = \frac{f^{(n+1)}(\xi(x))}{(n+1)!} (x-x_0)^{(n+1)}.$$

 $P_n(x)$ is called the **Taylor polynomial of degree** *n*, and $R_n(x)$ is the **remainder term** (truncation error).

This theorem is **extremely important** for numerical analysis; Taylor expansion is a fundamental step in the derivation of many of the algorithms we see in this class (and in Math 693ab).

-(19/63)

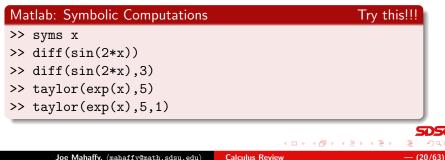

Taylor Expansions — Maple

- A **Taylor polynomial of degree** *n* requires all derivatives up to order *n* and degree *n* + 1 for the **Remainder**.
- In general, derivatives may be complicated expressions.
- Maple computes derivatives accurately and efficiently differentiation uses the command diff(f(x), x);
- Maple has a routine for Taylor series expansions finding the Taylor's series uses the command taylor(f(x), x=x0, n);, meaning the Taylor series expansion about x = x₀ using n terms in the expansion.
- A Maple worksheet is available with many of these basic commands through my webpage for this class.

Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

Taylor Expansions — Matlab

- A Taylor polynomial of degree *n* requires all derivatives up to order *n*, and order n + 1 for the **remainder**.
- Derivatives may be [more] complicated expression [than the original function].
- Matlab can compute derivatives for you:

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

(ロ) (部) (注) ()

Taylor's Theorem: Computer Programming – MatLab

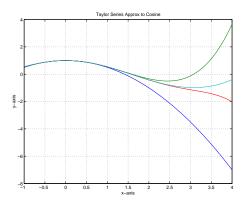

- Most versions of MatLab have a symbolic package that includes Maple, so this symbolic package can help with derivatives.
- Often easier to play to the strengths of each language and let Maple find the Taylor coefficients to employ in the MatLab code.
- MatLab provides relatively efficient numerical programs that are similar and based on C Programming.
- A MatLab code is provided to show the convergence of the Taylor series to the cosine function with increasing numbers of terms. This is shown on the Maple worksheet also, and the code is accessible through my webpage.

Limits, Continuity, and Convergence Differentiability, Rolle's, and the Mean Value Theorem Extreme Value, Intermediate Value, and Taylor's Theorem

イロト イヨト イヨト イヨト

A single char

Computers use a finite number of bits (0's and 1's) to represent numbers.

For instance, an 8-bit unsigned integer (a.k.a a "char") is stored:

27	2 ⁶	2 ⁵	24	2 ³	2 ²	2 ¹	20
0	1	0	0	1	1	0	1

Here, $2^6 + 2^3 + 2^2 + 2^0 = 64 + 8 + 4 + 1 = 77$, which represents the upper-case character "M" (US-ASCII).

Finite Precision

Binary Representation, IEEE 754-1985 Something's Missing... Roundoff and Truncation, Errors, Digits Cancellation

A 64-bit real number, double

The *Binary Floating Point Arithmetic Standard* 754-1985 (IEEE — The Institute for Electrical and Electronics Engineers) standard specified the following layout for a 64-bit real number:

 $s\,c_{10}\,c_9\,\ldots\,c_1\,c_0\,m_{51}\,m_{50}\,\ldots\,m_1\,m_0$

Where

Symbol	Bits	Description
5	1	The sign bit — 0=positive, 1=negative
С	11	The characteristic (exponent)
т	52	The mantissa

$$r = (-1)^{s} 2^{c-1023} (1+m), \quad c = \sum_{k=0}^{10} c_{k} 2^{k}, \quad m = \sum_{k=0}^{51} \frac{m_{k}}{2^{52-k}}$$

$$(1+m), \quad c = \sum_{k=0}^{10} c_{k} 2^{k}, \quad m = \sum_{k=0}^{51} \frac{m_{k}}{2^{52-k}}$$

$$(1+m), \quad c = \sum_{k=0}^{10} c_{k} 2^{k}, \quad m = \sum_{k=0}^{51} \frac{m_{k}}{2^{52-k}}$$

$$(1+m), \quad c = \sum_{k=0}^{10} c_{k} 2^{k}, \quad m = \sum_{k=0}^{51} \frac{m_{k}}{2^{52-k}}$$

Binary Representation, IEEE 754-1985 Something's Missing... Roundoff and Truncation, Errors, Digits Cancellation

Burden-Faires' Description is not complete...

As described in previous slide, we cannot represent zero!

There are some special signals in IEEE-754-1985:

Туре	S (1 bit)	C (11 bits)	M (52 bits)
signaling NaN	u	2047 (max)	.0uuuuu—u (with at least one 1 bit)
quiet NaN	u	2047 (max)	.1uuuuu—u
negative infinity	1	2047 (max)	.000000—0
positive infinity	0	2047 (max)	.000000—0
negative zero	1	0	.000000—0
positive zero	0	0	.000000—0

From: http://www.freesoft.org/CIE/RFC/1832/32.htm

Examples: Finite Precision

$$r = (-1)^{s} 2^{c-1023} (1+f), \quad c = \sum_{k=0}^{10} c_k 2^k, \quad m = \sum_{k=0}^{51} \frac{m_k}{2^{52-k}}$$

Example #1: 3.0

$$r_1 = (-1)^0 \cdot 2^{2^{10} - 1023} \cdot \left(1 + \frac{1}{2}\right) = 1 \cdot 2^1 \cdot \frac{3}{2} = 3.0$$

Example #2: The Smallest Positive Real Number

$$r_2 = (-1)^0 \cdot 2^{0-1023} \cdot (1+2^{-52}) = (1+2^{-52}) \cdot 2^{-1023} \cdot 1 \approx 10^{-308}$$

— (27/63)

Calculus Review Binary Representation, IEEE 754-1985 Computer Arithmetic & Finite Precision Something's Missing... Solutions of Equations of One Variable Cancellation

Examples: Finite Precision

$$r = (-1)^{s} 2^{c-1023} (1+f), \quad c = \sum_{k=0}^{10} c_k 2^k, \quad m = \sum_{k=0}^{51} \frac{m_k}{2^{52-k}}$$

Example #3: The Largest Positive Real Number

$$\begin{aligned} r_3 &= (-1)^0 \cdot 2^{1023} \cdot \left(1 + \frac{1}{2} + \frac{1}{2^2} + \dots + \frac{1}{2^{51}} + \frac{1}{2^{52}}\right) \\ &= 2^{1023} \cdot \left(2 - \frac{1}{2^{52}}\right) \approx 10^{308} \end{aligned}$$

<ロ> (四) (四) (三) (三)

- (28/63)

Something is Missing — Gaps in the Representation

There are gaps in the floating-point representation!

Given the representation

for the value $\frac{2^{-1023}}{2^{52}}$. The next larger floating-point value is

i.e. the value $\frac{2^{-1023}}{2^{51}}$. The difference between these two values is $\frac{2^{-1023}}{2^{52}} = 2^{-1075}$. Any number in the interval $\left(\frac{2^{-1023}}{2^{52}}, \frac{2^{-1023}}{2^{51}}\right)$ is not representable! 1 of 3

Calculus Review Computer Arithmetic & Finite Precision Algorithms Solutions of Equations of One Variable Calculus Review Binary Representation, IEEE 754-1985 Something's Missing... Roundoff and Truncation, Errors, Digits Cancellation

Something is Missing — Gaps in the Representation

A gap of 2^{-1075} doesn't seem too bad...

However, the size of the gap depend on the value itself...

Consider r = 3.0

and the next value

The difference is
$$rac{2}{2^{52}}pprox 4.4\cdot 10^{-16}.$$

イロン イヨン イヨン イヨン

Something is Missing — Gaps in the Representation

3 of 3

At the other extreme, the difference between

and the previous value

is
$$\frac{2^{1023}}{2^{52}} = 2^{971} \approx 1.99 \cdot 10^{292}.$$

That's a "fairly significant" gap!!!

The number of atoms in the observable universe can be estimated to be no more than $\sim 10^{80}.$

<ロ> (四) (四) (三) (三)

Calculus Review	Binary Representation, IEEE 754-1985	
Computer Arithmetic & Finite Precision	Something's Missing	
Algorithms	Roundoff and Truncation, Errors, Digits	
Solutions of Equations of One Variable	Cancellation	

The Relative Gap

It makes more sense to factor the exponent out of the discussion and talk about the relative gap:

Exponent	Gap	Relative Gap (Gap/Exponent)	
2 ⁻¹⁰²³	2^{-1075}	2 ⁻⁵²	
2 ¹	2^{-51}	2^{-52}	
2 ¹⁰²³	2 ⁹⁷¹	2 ⁻⁵²	

Any difference between numbers smaller than the local gap is not representable, *e.g.* any number in the interval

$$\left[3.0,\, 3.0 + \frac{1}{2^{51}} \right)$$

is represented by the value 3.0.

-(33/63)

The Floating Point "Theorem"

"Theorem"

Floating point "numbers" represent intervals!

Since (most) humans find it hard to think in binary representation, from now on we will **for simplicity** and **without loss of generality** assume that floating point numbers are represented in the normalized floating point form as...

k-digit decimal machine numbers

$$\pm 0.d_1d_2\cdots d_{k-1}d_k\cdot 10^n$$

where

$$1 \leq d_1 \leq 9, \quad 0 \leq d_i \leq 9, \ i \geq 2, \quad n \in \mathbb{Z}$$

k-Digit Decimal Machine Numbers

Any real number can be written in the form

 $\pm 0.d_1d_2\cdots d_\infty\cdot 10^n$

given infinite patience and storage space.

We can obtain the floating-point representation fl(r) in two ways:

- (1) Truncating (chopping) just keep the first k digits.
- (2) Rounding if $d_{k+1} \ge 5$ then add 1 to d_k . Truncate.

Examples

$$\mathtt{fl}_{t,5}(\pi) = 0.31415 \cdot 10^1, \quad \mathtt{fl}_{r,5}(\pi) = 0.31416 \cdot 10^1$$

In both cases, the error introduced is called the roundoff error.

イロト イポト イヨト イヨト

-(34/63)

Quantifying the Error

Let p^* be an approximation to p, then...

Definition (The Absolute Error)
$ p-p^* $

Definition (The Relative Error) $rac{|p-p^*|}{|p|}, \quad p eq 0$

Definition (Significant Digits)

The number of **significant digits** is the largest value of t for which

$$\frac{p - p^*|}{|p|} < 5 \cdot 10^{-t}$$

)50

Sources of Numerical Error

Binary Representation, IEEE 754-1985 Something's Missing... Roundoff and Truncation, Errors, Digits Cancellation

Important!!!

- 1) Representation Roundoff.
- 2) Cancellation Consider:

 $0.12345678012345 \cdot 10^{1}$

- $0.12345678012344 \cdot 10^{1}$

 $= 0.100000000000 \cdot 10^{-13}$

this value has (at most) 1 significant digit!!!

If you assume a "canceled value" has more significant bits (the computer will happily give you some numbers) — I don't want you programming the autopilot for any airlines!!!

イロン イヨン イヨン イヨン

Examples: 5-digit Arithmetic

Rounding 5-digit arithmetic

$$(96384 + 26.678) - 96410 =$$

 $(96384 + 00027) - 96410 =$
 $96411 - 96410 = 1.0000$

Truncating 5-digit arithmetic

$$(96384 + 26.678) - 96410 =$$

 $(96384 + 00026) - 96410 =$
 $96410 - 96410 = 0.0000$

Rearrangement changes the result:

(96384 - 96410) + 26.678 = -26.000 + 26.678 = 0.67800

Numerically, order of computation matters! (This is a HARD problem)

Algorithms	Roundoff and Truncation, Errors, Digits	
Solutions of Equations of One Variable	Cancellation	

Example: Loss of Significant Digits due to Subtractive Cancellation

Consider the recursive relation

$$x_{n+1} = 1 - (n+1)x_n$$
 with $x_0 = 1 - \frac{1}{e}$

This sequence can be shown to converge to 0 (in 2 slides).

Subtractive cancellation produces an error which is approximately equal to the machine precision times n!.

The MatLab code for this example is provided on the webpage.

Maple has a routine **rsolve** that solves this recursive relation exactly, using the Gamma function.

Subtractive Cancellation Example: Output

n	Xn	n!	n	Xn	n!
0	0.63212056	1	11	0.07735223	3.99e+007
1	0.36787944	1	12	0.07177325	4.79e+008

Calculus Review Computer Arithmetic & Finite Precision Algorithms Solutions of Equations of One Variable Calculus Review Binary Representation, IEEE 754-1985 Something's Missing... Roundoff and Truncation, Errors, Digits Cancellation

Example: Proof of Convergence to 0

The recursive relation is

$$x_{n+1} = 1 - (n+1)x_n$$

with

$$x_0 = 1 - \frac{1}{e} = 1 - \frac{1}{2!} + \frac{1}{3!} - \frac{1}{4!} + \dots$$

From the recursive relation

$$\begin{aligned} x_1 &= 1 - x_0 = \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} - \dots \\ x_2 &= 1 - 2x_1 = \frac{1}{3} - \frac{2}{4!} + \frac{2}{5!} - \dots \\ x_3 &= 1 - 3x_2 = \frac{3!}{4!} - \frac{3!}{5!} + \frac{3!}{6!} - \dots \end{aligned}$$

$$x_n = 1 - nx_{n-1} = \frac{n!}{(n+1)!} - \frac{n!}{(n+2)!} + \frac{n!}{(n+3)!} - \dots$$

This shows that

$$x_n = \frac{1}{n+1} - \frac{1}{(n+1)(n+2)} + \dots \to 0 \quad \text{as} \quad n \to \infty.$$

Algorithms, Pseudo-Code Fundamental Concepts

・ロト ・ ア・ ・ ヨト ・ ヨト

-(42/63)

Algorithms

Definition (Algorithm)

An **algorithm** is a procedure that describes, in an **unambiguous manner**, a finite sequence of steps to be performed in a specific order.

In this class, the objective of an algorithm is to implement a procedure to solve a problem or approximate a solution to a problem.

Most homes have a collection of algorithms in printed form — we tend to call them "recipes."

There is a collection of algorithms "out there" called **Numerical Recipes**, google for it!

Algorithms, Pseudo-Code Fundamental Concepts

Pseudo-code

Definition (Pseudo-code)

 $\ensuremath{\textbf{Pseudo-code}}$ is an algorithm description which specifies the input/output formats.

Note that pseudo-code is **not** computer language specific, but should be easily translatable to any procedural computer language.

Examples of Pseudo-code statements:

for i = 1,2,...,n
Set
$$x_i = a_i + i * h$$

While $i < N$ do Steps 17 - 21
If ... then ... else

- ∃ →

-(43/63)

Algorithms, Pseudo-Code Fundamental Concepts

Stability

-(44/63)

Key Concepts for Numerical Algorithms

Definition (Stability)

An algorithm is said to be stable if small changes in the input, generates small changes in the output.

At some point we need to quantify what "small" means!

If an algorithm is stable for a certain **range** of initial data, then is it said to be **conditionally stable**.

Stability issues are discussed in great detail in Math 543.

・ロト ・ ア・ ・ ヨト ・ ヨト

Algorithms, Pseudo-Code Fundamental Concepts

Suppose $E_0 > 0$ denotes the initial error, and E_n represents the error after *n* operations.

If $E_n \approx C E_0 \cdot n$ (for a constant C which is independent of n), then the growth is **linear**.

If $E_n \approx C^n E_0$, C > 1, then the growth is **exponential** — in this case the error will dominate very fast (undesirable scenario).

・ロト ・ ア・ ・ ヨト ・ ヨト

Algorithms, Pseudo-Code Fundamental Concepts

Suppose $E_0 > 0$ denotes the initial error, and E_n represents the error after *n* operations.

If $E_n \approx C E_0 \cdot n$ (for a constant C which is independent of n), then the growth is **linear**.

If $E_n \approx C^n E_0$, C > 1, then the growth is **exponential** — in this case the error will dominate very fast (undesirable scenario).

Linear error growth is usually unavoidable, and in the case where C and E_0 are small the results are generally acceptable. — **Stable algorithm**.

Exponential error growth is unacceptable. Regardless of the size of E_0 the error grows rapidly. — **Unstable algorithm**.

イロン イヨン イヨン イヨン

Algorithms, Pseudo-Code Fundamental Concepts

The recursive equation

Example BF-1.3.3

$$p_n = \frac{10}{3}p_{n-1} - p_{n-2}, \quad n = 2, 3, \dots, \infty$$

has the exact solution

$$p_n = c_1 \left(\frac{1}{3}\right)^n + c_2 3^n$$

for any constants c_1 and c_2 . (Determined by starting values.) In particular, if $p_0 = 1$ and $p_1 = \frac{1}{3}$, we get $c_1 = 1$ and $c_2 = 0$, so $p_n = \left(\frac{1}{3}\right)^n$ for all n.

Now, consider what happens in 5-digit rounding arithmetic...

イロト イポト イヨト イヨト

Example BF-1.3.3

Algorithms, Pseudo-Code Fundamental Concepts

Now, consider what happens in 5-digit rounding arithmetic...

$$p_0^* = 1.0000, \quad p_1^* = 0.33333$$

which modifies

$$c_1^* = 1.0000, \quad c_2^* = -0.12500 \cdot 10^{-5}$$

The generated sequence is

$$p_n^* = 1.0000 (0.33333)^n - \underbrace{0.12500 \cdot 10^{-5} (3.0000)^n}_{\text{Exponential Growth}}$$

 p_n^* quickly becomes a very poor approximation to p_n due to the exponential growth of the initial roundoff error.

・ロト ・四ト ・ヨト

Algorithms, Pseudo-Code Fundamental Concepts

Reducing the Effects of Roundoff Error

The effects of roundoff error can be reduced by using higher-order-digit arithmetic such as the double or multiple-precision arithmetic available on most computers.

Disadvantages in using double precision arithmetic are that it takes more computation time and **the growth of the roundoff error is not eliminated but only postponed**.

Sometimes, but not always, it is possible to reduce the growth of the roundoff error by restructuring the calculations.

イロト イポト イヨト イヨト

— (48/63)

Algorithms, Pseudo-Code Fundamental Concepts

Key Concepts

Rate of Convergence

Definition (Rate of Convergence)

Suppose the sequence $\underline{\beta} = \{\beta_n\}_{n=1}^{\infty}$ converges to zero, and $\underline{\alpha} = \{\alpha_n\}_{n=1}^{\infty}$ converges to a number α .

If $\exists K > 0$: $|\alpha_n - \alpha| < K\beta_n$, for *n* large enough, then we say that $\{\alpha_n\}_{n=1}^{\infty}$ converges to α with a **Rate of Convergence** $\mathcal{O}(\beta_n)$ ("Big Oh of β_n ").

We write

$$\alpha_n = \alpha + \mathcal{O}(\beta_n)$$

Note: The sequence $\underline{\beta} = \{\beta_n\}_{n=1}^{\infty}$ is usually chosen to be

$$\beta_n = \frac{1}{n^p}$$

for some positive value of p.

Algorithms, Pseudo-Code Fundamental Concepts

(a) <</p>

- (50/63)

Examples: Rate of Convergence

Example #1: If

$$\alpha_n = \alpha + \frac{1}{\sqrt{n}}$$

then for any $\epsilon > 0$

$$|\alpha_n - \alpha| = \frac{1}{\sqrt{n}} \leq \underbrace{(1+\epsilon)}_{K} \underbrace{\frac{1}{\sqrt{n}}}_{\beta_n}$$

hence

$$\alpha_n = \alpha + \mathcal{O}\left(\frac{1}{\sqrt{n}}\right)$$

Fundamental Concepts

Examples: Rate of Convergence

Example #2: Consider the sequence (as $n \to \infty$)

$$\alpha_n = \sin\left(\frac{1}{n}\right) - \frac{1}{n}$$

We **Taylor expand** sin(x) about $x_0 = 0$:

$$\sin\left(\frac{1}{n}\right) \sim \frac{1}{n} - \frac{1}{6n^3} + \mathcal{O}\left(\frac{1}{n^5}\right)$$

Hence

$$|\alpha_n| = \left|\frac{1}{6n^3} + \mathcal{O}\left(\frac{1}{n^5}\right)\right|$$

It follows that

$$\alpha_n = \mathbf{0} + \mathcal{O}\left(\frac{1}{n^3}\right)$$

Note: (

$$\mathcal{O}\left(\frac{1}{n^3}\right) + \mathcal{O}\left(\frac{1}{n^5}\right) = \mathcal{O}\left(\frac{1}{n^3}\right), \quad \text{since} \quad \frac{1}{n^5} \ll \frac{1}{n^3}, \text{ as } n \to \infty$$

Joe Mahaffy, (mahaffy@math.sdsu.edu)

Algorithms and Convergence

Algorithms, Pseudo-Code Fundamental Concepts

Generalizing to Continuous Limits

Definition (Rate of Convergence)

Suppose

$$\lim_{h \searrow 0} G(h) = 0, \text{ and } \lim_{h \searrow 0} F(h) = L$$

If $\exists K > 0$:

$$|F(h) - L| \le K |G(h)|$$

 $\forall h < H$ (for some H > 0), then

$$F(h) = L + \mathcal{O}(G(h))$$

we say that F(h) converges to L with a **Rate of Convergence** $\mathcal{O}(G(h))$.

Usually $G(h) = h^p$, p > 0.

Algorithms, Pseudo-Code Fundamental Concepts

Examples: Rate of Convergence

Example #2-b: Consider the function $\alpha(h)$ (as $h \rightarrow 0$)

 $\alpha(h) = \sin{(h)} - h$

We **Taylor expand** sin(x) about $x_0 = 0$:

$$\sin(h) \sim h - rac{h^3}{6} + \mathcal{O}(h^5)$$

Hence

$$\alpha(h)| = \left|\frac{h^3}{6} + \mathcal{O}\left(h^5\right)\right|$$

It follows that

$$\lim_{h\to 0} \alpha(h) = \mathbf{0} + \mathcal{O}\left(h^3\right)$$

Note:

$$\mathcal{O}\left(h^{3}\right) + \mathcal{O}\left(h^{5}\right) = \mathcal{O}\left(h^{3}\right), \quad \text{since} \quad h^{5} \ll h^{3}, \text{ as } h \to 0 \quad \text{source} \quad h^{5} \ll h^{3}, h \to 0 \quad \text{source} \quad h^{5} \gg h^{3} \mapsto h^{3} \to 0 \quad \text{source} \quad h^{5} \gg h^{3} \mapsto h^{3} \to 0 \quad \text{source} \quad h^{5} \gg h^{3} \to 0 \quad \text{source} \quad h^{3} \to 0 \quad h^{3} \to 0 \quad \text{source} \quad h^{3} \to 0 \quad h^{3} \to 0 \quad \text{source} \quad h^{3}$$

f(x) = 0, "Root Finding"
The Bisection Method
When do we stop?!
*** Homework #1 ***

Solutions of Equations of One Variable

We are going to solve the equation f(x) = 0 (*i.e.* finding root to the equation), for functions f that are complicated enough that there is no closed form solution (and/or we are too lazy to find it?)

In a lot of cases we will solve problems to which we can find the closed form solutions — we do this as a training ground and to evaluate how good our numerical methods are.

・ロト ・ ア・ ・ ヨト ・ ヨト

Introduction

The Bisection Method

Suppose f is continuous on the interval (a_0, b_0) and $f(a_0) \cdot f(b_0) < 0$ — This means the function changes sign at least once in the interval.

The **intermediate value theorem** guarantees the existence of $c \in (a_0, b_0)$ such that f(c) = 0.

Without loss of generality (just consider the function -f(x)), we can assume (for now) that $f(a_0) < 0$.

We will construct a sequence of intervals containing the root c:

$$(a_0, b_0) \supset (a_1, b_1) \supset \cdots \supset (a_{n-1}, b_{n-1}) \supset (a_n, b_n) \ni c$$

・ロト ・四ト ・ヨト ・ヨト

The Bisection Method

The sub-intervals are determined recursively:

Given
$$(a_{k-1}, b_{k-1})$$
, let $m_k = \frac{a_{k-1} + b_{k-1}}{2}$ be the mid-point.

If $f(m_k) = 0$, we're done, otherwise

$$(a_k, b_k) = \left\{ egin{array}{cc} (m_k, b_{k-1}) & ext{if } f(m_k) < 0 \ (a_{k-1}, m_k) & ext{if } f(m_k) > 0 \end{array}
ight.$$

This construction guarantees that $f(a_k) \cdot f(b_k) < 0$ and $c \in (a_k, b_k)$.

イロト イヨト イヨト イヨト

The Bisection Method

After *n* steps, the interval (a_n, b_n) has the length

$$|b_n-a_n|=\left(\frac{1}{2}\right)^n|b_0-a_0|$$

f(x) = 0, "Root Finding"

The Bisection Method

*** Homework #1 ***

we can take

$$m_{n+1}=\frac{a_n+b_n}{2}$$

as the estimate for the root c and we have

$$c = m_{n+1} \pm d_n, \quad d_n = \left(\frac{1}{2}\right)^{n+1} |b_0 - a_0|$$

The Bisection Method

f(x) = 0, "Root Finding"
The Bisection Method
When do we stop?!
*** Homework #1 ***

Convergence is slow:

At each step we gain **one binary digit in accuracy.** Since $10^{-1} \approx 2^{-3.3}$, it takes on average 3.3 iterations to gain one decimal digit of accuracy.

Note: The rate of convergence is completely independent of the function f.

We are only using the **sign of** f at the endpoints of the interval(s) to make decisions on how to update. — By making more effective use of the values of f we can attain significantly faster convergence.

First an example...

 Solutions of Equations of One Variable
 **** Homework #1 ***

Stopping Criteria

When do we stop? We can (1) keep going until successive iterates are close:

$$|m_{k+1}-m_k|<\epsilon$$

or (2) close in relative terms

$$\frac{|m_{k+1}-m_k|}{|m_{k+1}|} < \epsilon$$

or (3) the function value is small enough

 $|f(m_{k+1})| < \epsilon$

No choice is perfect. In general, where no additional information about f is known, the second criterion is the preferred one (since it comes the closest to testing the relative error).

— (63/63)
